Milestone 3
Group 111-4
11/3/19

Features we had working during the demo:
1. Website with different pages for different locations
2. Database with dummy data setup for data from multiple locations

      A problem we faced during the demo is that we didn't have any working connection between the database and website or the database and the raspberry pi we are using for data collection.

      The TA listened to our initial idea of having a local database on each pi and instead suggested that we setup a node js server to handle the data transfer from the pi to a central database and from the database to the frontend website.
